Enterprise Identity & Access Management (IAM) Standard

Document ID: ARCH-SEC-2026-04 | **Owner:** Cloud Infrastructure Security | **Date:** 02 February 2026

Core Principles

All corporate access operates under the Principle of Least Privilege (PoLP) and Zero Trust Architecture (ZTA). Network perimeter location confers zero baseline trust.

Multi-Factor Authentication

Phishing-resistant FIDO2/WebAuthn hardware tokens or managed authenticator applications are mandatory for all production cloud consoles and code repositories.

Privileged Access Management (PAM)

Permanent administrative access is prohibited. Production infrastructure credentials must be provisioned via Just-In-Time (JIT) access broker with automatic revocation after four hours.

Quarterly Access Reviews

Department heads must review and certify entitlements for all direct reports every 90 days. Uncertified roles are revoked automatically at day 95.
